Risk Assessment Report

Methionine (Fourth edition)

(Exempted Substances¹)

Food Safety Commission of Japan (FSCJ)
March 2024

ABSTRACT

Methionine has been designated as an exempted substance by the Minister of Health, Labour and Welfare. This substance does not have adverse effects on human health in accordance with the provision of Article 13 paragraph (3) of the Food Sanitation Act (Act No. 233 of 1947). The FSCJ reassessed methionine on the premise of assessing a feed additive of the isopropyl ester of methionine hydroxy analog (HMBi)² requested by the Ministry of Agriculture, Forestry and Fisheries (MAFF) as methionine is an active substance of HMBi. Referring to various documents and submitted data by the MAFF on the new scientific findings, specifically the results of the genotoxicity study for HMBi, the FSCJ reaffirmed the previously assessed view on methionine.

The FSCJ assessed methionine in 2012, 2017 and 2019. The new scientific findings did not affect the existing assessment results. The description of methionine and its hydroxy analog stated in 2017 and 2019 should be reiterated as follows.

- Methionine is an amino acid composed of proteins. Humans usually take proteins containing methionine as macronutrients through food.
- Methionine and 2-deamino-2-hydroxymethionine (HMTBa) (a hydroxy analog of methionine, which is metabolized to methionine *in vivo*) administered to animals are used for the consecutive metabolic processes of Intra-Cellular proteins. As they are metabolized *in vivo* in animals without accumulating there, it is assumed that humans would not consume too much of those substances (derived from veterinary medicinal products and feed additives) through food.
- The use of methionine-based veterinary medicinal products, additives and others have not caused particular safety issues.
- Given the above, the FSCJ thought that there would be no concern about adverse effects on human health

¹ On May 29, 2006, the Ministry of Health, Labour and Welfare (MHLW) introduced the positive list system for agricultural chemicals remaining in foods- the system to prohibit the distribution of foods that contain agricultural chemicals above a certain level if maximum residue limits (MRLs) have not been established. Exempted Substances are defined by the MHLW as substances having no potential to cause damage to human health, based on the provision of Article 13, paragraph (3) of the revised Food Sanitation Act. These substances are not subject to the positive list system.

² Food safety assessment of effects on health is a prerequisite of the regulatory process for the criteria and specification of feed additives established by the risk management organizations (MAFF, MHLW and Consumer Affairs Agency).

through the residues in food as long as methionine is normally applied as a veterinary medicinal product or a feed additive.
