## Risk Assessment Report

### Prothiofos (Pesticides)

Food Safety Commission of Japan (FSCJ)  
October 2018

#### ABSTRACT

FSCJ established health based guidance values of prothiofos (CAS No.34643-64-4), an organophosphorus insecticide based on results from various studies in the risk assessment.

The data used in the assessment include fate in animals (rats), fate in plants (apples, Chinese cabbage and others), residue in crops, subacute toxicity (rats, mice and dogs), subacute neurotoxicity (rats), chronic toxicity (rats and dogs), combined chronic toxicity/carcinogenicity (rats and mice), carcinogenicity (mice), two-generation and three-generation reproductive toxicity (rats), developmental toxicity (rats and rabbits) and genotoxicity.

The major adverse effect of prothiofos was inhibition of cholinesterase (ChE) activity in the brain and erythrocyte, neurotoxicity (tremor etc.) and suppressed body weight. No carcinogenicity, reproductive toxicity or genotoxicity was observed.

Prothiofos increased the incidences of open eyelid, bent ribs and femoral dysplasia of fetus at the maternal toxic dose in a rabbit developmental toxicity study. No teratogenicity was observed in rats.

On the basis of various studies, prothiofos (parent compound only) was identified as a relevant substances for residue definition for dietary risk assessment in agricultural products.

The lowest no-observed-adverse-effect level (NOAEL) obtained in all studies was 0.27 mg/kg bw/day in a two-year combined chronic toxicity/carcinogenicity study in rats. FSCJ specified an acceptable daily intake (ADI) of 0.027 mg/kg bw/day by applying a safety factor of 100 to the NOAEL.

The lowest NOAEL for adverse effects of eliciting a single oral administration of prothiofos was 5 mg/kg bw/day obtained in acute neurotoxicity study in rats. FSCJ specified an acute reference dose (ARfD) to be 0.05 mg/kg bw by applying a safety factor of 100 to the NOAEL.

**Table 1. Levels relevant to toxicological evaluation of prothiofos**

| Species | Study  | Dose<br>(mg/kg bw/day)   | NOAEL (mg/kg bw/day)  |
|---------|--|--|---|
|         |  |  | Critical endpoints <sup>1)</sup>  |
